

Front End Developer Task

Build a landing page based on the attached design that aims to get users to fill in the form and sign up.

Important things to note:

- The page should utilise best practice for any Javascript, CSS and HTML that you write;
- The form does not need to function past front end (You don't need to send anything to a server or write to a database);
- The form should use validation for the email address with appropriate user errors;
- You may use a CSS framework (e.g. Bootstrap, Foundation, etc.) to provide the base styles for your page; and
- You may use a Javascript library (such as jQuery) for speed ;

Any other considerations (button hovers, appropriate anchor links any transitions) are at your discretion. All images needed to complete the page are attached with this document. The font used is Merriweather (weights: 400,700) and can be found on Google Fonts.

You can zip up the project files and send to us or direct us to a Git repository.
